Ismertető a feladathoz

Fontos információk

Ha kifutsz az adott feladatlap kitöltésére rendelkezésre álló időből, a felület **automatikusan megpróbálja beküldeni** az addig megadott válaszokat

A kérdésekre **mindig van helyes válasz!** Ha csak egy helyes válasz van az adott kérdésre, radio button-os választási lehetőségeket fogsz látni.

Olyan kérdés viszont nincs, amelyre az összes válasz helyes!

Egyéb információkat a [versenyszabályzatban](#) találsz!

2nd round – Testing, SQLAlchemy

Felhasznált idő: 01:49/15:00

Elért pontszám: 0/6

1. feladat 0/3 pont

Given the SystemUnderTest and a Validator, select which TestValidatorN class constitutes a stub, a mock, a dummy or a spy.

```
from abc import ABC, abstractclassmethod
```

```
class Validator(ABC):
```

```
    @abstractclassmethod
```

```

def validate(name: str) -> bool:

    pass

class SystemUnderTest():

    def __init__(self, validator: Validator) -> None:

        self._validator = validator

    def publicApiDoesNotValidate(self) -> str:

        return 'OK'

    def publicApiDoesValidate(self, input_str: str) -> str:

        return 'OK' if self._validator.validate(input_str) else 'NOT OK'

class A(Validator):

    def validate(self, name: str) -> bool:

        raise Exception('not yet implemented')

class B(Validator):

    def validate(self, name: str) -> bool:

        return True

class C(Validator):

    def __init__(self, doesValidate: bool = True) -> None:

        super().__init__()

        self.doesValidate = doesValidate

        self.wasValidationCalled = False

    def validate(self, name: str) -> bool:

        self.wasValidationCalled = True

        return self.doesValidate

class D(Validator):

    def __init__(self, doesValidate: bool = True, validationMaxCalls = 1) -> None:

        super().__init__()

        self.doesValidate = doesValidate

```

```

        self.validationMaxCalls = validationMaxCalls

        self.wasValidationCalled = 0

    def validate(self, name: str) -> bool:

        self.wasValidationCalled += 1

        assert self.wasValidationCalled <= self.validationMaxCalls, "Validation was called more than i

        return self.doesValidate

```

Please put class names A, B, C and D in the order of Dummy, Mock, Spy, Stub. The answer should be like D, C, B, A.

Válaszok

A helyes válasz:

A, D, C, B
 ADCB
 A D C B
 A,D,C,B
 A, D C B

Magyarázat

Stub — used for providing the tested code with "indirect input".

Mock object — used for verifying "indirect output" of the tested code, by first defining the expectations before the tested code is executed.

Spy — used for verifying "indirect output" of the tested code, by asserting the expectations afterwards, without having defined the expectations before the tested code is executed. It helps in recording information about the indirect object created.

Dummy object — used when a parameter is needed for the tested method but without actually needing to use the parameter.

2. feladat 0/3 pont

Create a trip SQLAlchemy model, with an ID, LAT and LON coordinates.

Válasz

```
class Trip(Base):
```

```
__tablename__ = 'trips'
```

```
id = Column(String)
```

```
lat = Column(Float)
```

```
lon = Column(Float)
```

```
class Trip(Base):
```

```
    table = 'trips'
```

```
    id = Column(String)
```

```
    lat = Column(Float)
```

```
    lon = Column(Float)
```

```
class Trip(Base):
```

```
    table = 'trips'
```

```
    id: str
```

```
    lat: float
```

```
    lon: float
```

```
@alchemy('trips')
```

```
class Trip:
```

```
    id: String
```

```
    lat: Double
```

```
    lon: Double
```

Magyarázat

Table name must be defined as `__tablename__`

Column values must be instances of sqlalchemy column objects

There is no `@alchemy` decorator
